India Grace Daniel

igracedaniel@gmail.com | 240.565.8093 | Portfolio | LinkedIn | github.com/igdaniel-1 | hitmarker.net/igdaniel

Product-minded software engineer and former Acting CTO who ships production full-stack systems (Python, React, PostgreSQL) with Claude Code, from an AI-assisted ETL pipeline for patient and insurance data at a hackathon I led as Project Manager, to a CRM for a community nonprofit. Experienced in regulated fields (federal shipping compliance with DOT Hazmat certification, finance data integrity at Susquehanna) and in hiring and leading engineering teams.

EDUCATION

New York University and New York University Shanghai
B.S. Computer Science, Minor in French. *2022*
Relevant Coursework: Data Structures, Computer Architecture, Operating Systems, Artificial Intelligence, Software Engineering

EXPERIENCE

Software Engineer | DregsBane Systems Robotics | Remote | 03/2026 – Present
• Led cross-functional project across mechanical, technical, and business teams which translated robot task and mobility requirements into a CAD model, establishing an early collaborative culture laterally across the startup.
• Prototyped navigation software and delivered the company's first product demo, presenting early design concepts to founders and external clients to strengthen investment and advertising pitches.
• Built a ThreeJS simulation environment to visualize navigation software and run initial software-in-the-loop (SIL) tests.

Software Engineer | hackNY Engineering Fellowship, Prospect Heights Community Farms | New York, NY | 05/2026 – 08/2026
• Architected an embedded CRM on PostgreSQL, designing the database and access model for visitor and admin data while avoiding costly third-party software.
• Used agentic AI development (Claude Code) to scaffold the React application and codebase, freeing time to make the UI broadly accessible.
• Built a bulk-update admin feature so non-technical staff can upload and manage database records quickly, reducing long-term consultant fees.
• Built separate member and admin interfaces. Members can reach only their own encrypted data, and shared group data is de-identified where records overlap (e.g., shared farm resources).
• Deployed the React front end on Vercel, sharply cutting hosting costs and time to launch.
• Wrote Golang tooling that deploys the front- and back-end servers concurrently with a single command, and documented deployment and upkeep for a low-tech external admin team.

IT Project Manager | Susquehanna International Group | Bala Cynwyd, PA | 04/2024 – 11/2024
• Identified a trade-critical server data integrity failure and secured emergency fail-safe data before it affected active trading strategies.
• Led a multi-disciplinary team to design a traceable data verification pipeline that met defined financial-sector security requirements.
• Wrote Bash automation on Linux to schedule verification tasks, and mandated emergency fallback data to improve integrity.
• Converted legacy Grafana dashboards into Python monitoring agents that alert support teams during emergencies.
• Oversaw personnel operations across multiple data centers and recovered over $370K in underutilized server hardware for trading workloads.

Lead Software Engineer & Acting CTO | Resell Marketplace | New York, NY | 07/2022 – 03/2024
• Acted as CTO of a C2C eCommerce startup, owning technical direction, architecture, and Git management for the full-stack React Native/TypeScript codebase as it was built from scratch.
• Interviewed, hired, and led an agile team of 4 developers, including international members, to build a marketplace personalization engine and the company's first shipping pipeline.
• Earned DOT Hazmat Certification and led the shipping-provider relationship, designing a compliance system that integrated their API with federal shipping regulations.
• Built a Stripe (OAuth) payment pipeline for real-time payment verification and transaction mapping, updating product status in the Google Cloud PostgreSQL database.
• Developed API endpoints connecting the database to the React front end, with filtered, paginated search to cut page-load latency.
• Built the company's first CI/CD pipeline and back-end integration tests to validate database entries and match the purchasing experience to wireframes.
• Established an Agile scrum culture with Jira, sprint planning, and daily cross-functional standups.

PROJECTS

Machine Learning Sign Language Translator | iOS Application | GitHub
• Designed, built, and shipped an on-device ML translation app to the App Store that delivers real-time sign language translation with no WiFi or server dependency.
• Engineered end-to-end feature pipeline: fused LiDAR point-cloud data with Apple Vision hand-pose extraction to convert raw spatial input into classified hand-sign features for the model's dictionary classification system.
• Trained and iteratively recalibrated the model for fairness, validating performance across a range of hand sizes, skin tones, and backgrounds to reduce error disparity across skin tones and raise translation accuracy to a minimum of 76%.
• Built a continuous feedback loop: an API endpoint syncing opt-in user data to a remote MongoDB store, used to retrain and redeploy updated model versions.

Pulse Foundry NYC Hackathon | Health Insurance Client Management System | GitHub
• Led a 5-engineer Applied AI Hackathon team as Project Manager, owning Git version control and merge strategy for a full-stack Python/React insurance eligibility system; authored process documentation and execution runbooks for handoff.
• Used Claude Code to build a Python ETL pipeline that retrieves, parses, and validates patient and insurance profile data from a mock PointClickCare API, feeding an access-protected React interface for eligibility review.
• Implemented automated eligibility classification that cross-checks insurance qualification parameters against a defined scoring threshold, replacing manual checks and cutting daily friction for healthcare professionals reviewing claims.

Document Analysis RAG | AI Language Assistant | GitHub
• Engineered a Python-based RAG tool that generates contextual highlights from a document according to target industry.
• Retrieves external filters through RESTful API calls to identify industry-specific and high-frequency categorical keywords.

Satellite Trajectory Analysis | Python GUI App | GitHub
• Designed and implemented the full application stack in Python with a computational backend, Tkinter-based UI, and Matplotlib visualization layer to allow users to input orbital parameters and generate updated trajectory predictions on demand.

ACTIVITIES & LEADERSHIP

NYU Varsity Athletics
Soccer

NYU Alumni Outreach - French In Motion
• Organizing film screenings amongst NYU grads in NYC and DC, creating networking spaces and spotlighting international films.

IEEE
• Biometrics, Electronic Design Automation, and Systems, Man, and Cybernetics Societies

SKILLS

Languages: Python, JavaScript, TypeScript, C, C++, Bash, Go

Integration & Data: RESTful APIs, API Development, JSON, Data Integration, Google Cloud Storage API, Stripe API, Redux

Databases & DevOps: PostgreSQL, SQL, MongoDB, Docker, GitHub CI/CD

Spoken Languages: French (Fluent), Mandarin Chinese (Conversational), Italian (Conversational)
